

TROPHOZOITES OF BLASTOCYSTIS HOMINIS IN-VITRO CULTURE TROFOZOITOS DE BLASTOCYSTIS HOMINIS EN CULTIVO IN-VITRO

Sebastian Iglesias-Osores^{1,a}, Heber Silva-Díaz^{2,b}, Lorena Flores-Esqueche^{1,a}. Dunalia Llatas-Cancino^{1,a}.

Blastocystis hominis is a unicellular organism found in the intestines of humans and animals, its morphological forms (vacuolar, granular, cystic and ameboid), there is controversy in its pathological role. In vivo studies in guinea pigs inoculated with *B. hominis* caused diarrhea although, its pathological role was not fully demonstrated. It is normally 5 μm diameter with a large central vacuole in culture. The culture was inoculated with fresh fecal samples, into tubes with Loocke Modified Solution and then were incubated at 36 °C and 5% CO₂, with a 46.3% frequency observed, being a public health problem⁽¹⁾.
